Nursing Process & Clinical Judgment Model

Recognize & Analyze Cues		
Assessment (Data Collection-Cues) Subjective data: Why did the patient seek healthcare? Is this still an ongoing problem? Objective data: Abnormal assessment findings,Vital signs,lab results,Dx test results, Significant PMH Braden score___Fall risk____ What assessment information is most important? What is of immediate concern?	Problem Identification List recognizing and analyzing cues Actual Problems /Potential Problems What client conditions are consistent with the cues? Are there cues that support or contraindicate a particular condition?	**D**iagnosis (Nursing Diagnosis) Does not need to be NANDA List top 3 priority problems in order of priority using Maslow's Hierarchy, ABC's, acute before chronic, acute before chronic, stable before unstable and explain. Problem #1 Problem #2 Problem #3

Problem#1 Prioritize Hypotheses	Generate Solutions/Identify Outcomes
(Related to) 1. List several possible causes for the problem 2..What factors are most likely contributing to the problem and why? (AEB as evidenced by) 3.What were the clinical manifestations that suggested the problem?	**P**lanning (desired outcomes/goals/Interventions) What are the desirable outcomes? What interventions can achieve those outcomes? What should be avoided? SMART GOALS

Take Action/Implementation of Interventions	Evaluate Outcomes
Implementation List interventions carried out 1. 2. 3. 4. Medication intervention 5. Education intervention Which of the following actions should the nurse initiate first?	**E**valuation 1. Was intervention appropriate/effective? How did/would you measure effectiveness? 2. Was intervention appropriate/effective? How did/would you measure effectiveness? 3. Was intervention appropriate/effective? How did/would you measure effectiveness?
